

Danny,

On the contest problem, they had 2 roofed waters that you had to pump in # 2 to get in the mine. When you pumped the first one and got in by it, you moved the pump up to the second water roofed in by you. Then, the water out by you roofed back as you prepare to pump the 2nd one. When you find the 2 guys behind the barricade in # 1 and vent and go in barricade, they give you the note that the power is out of the mine. This means the water roofed back and you have to take them out the cutout that you have not gotten to yet due to delaying the patient. They had a low O2 placard as you see out by the temporary built by the other team. They wanted you to put protection on both and walk them out; or at that stop, captain walk out one under O2 and come back and get the other one and protect while the team stays with him. Some also advanced the patients with them to build back the stopping in next to last xcut between # 2 and # 3 and then go back up and vent out the low O2 with the patients on the intake side. They accepted either.
